Кафедра ИИТ

Лабораторная работа №4

За шестой семестр

По дисциплине: «Модели решения задач в ИС»

Тема: «Классификация линейно разделимых образов однослойным персептроном для логических функций n переменных»

Выполнил:
Студент 3 курса
Группы ИИ-26(1)
Пилипук М.А.
Проверил:
Андренко К. В.

Брест 2026

Цель: Реализовать нейронную сеть для решения задач синтеза логических функций от n входов. Сравнить эффективность обучения при различных начальных условиях.

N = 7, функция — инвертированное ИЛИ.

Угадайте где находится код программы.

Ради интереса и эксперимента будем использовать следующий «алгоритм» инверсии:

```
mask = np.array([0, 0, 0, 1, 1, 0, 0])
```

График зависимости MSE от эпохи.

MSE minimized at epoch = 2756
MSE minimized at epoch = 2466
Final Weights (Fixed): [-0.15245113 -0.15245113 -0.15245113 2.87416459 2.87416459 -0.15245113

Проглядывается интересная закономерность, что единицы, идущие прямо после нулей, имеют меньший шанс уверенности, чем единицы, находящиеся перед нулями. Учитывая что паттерн в целом повторяется, а количество 0 — довольно низкое, то очевидно, что будет подобный результат.

Вывод: реализовал нейронную сеть для синтеза логической функции от n входов.
